SUNRISE CLASSES

The BIOS is firmware stored on a chip on the motherboard. It provides the basic instructions to initialize the hardware components, perform self-tests, and start the operating system when the computer is powered on.

147. The correct answer is a) Its physical size and shape
The form factor of a motherboard refers to its physical dimensions, shape, and layout. Different form factors exist, such as ATX, Micro-ATX, and Mini-ITX, which determine the size and compatibility with computer cases.

148. The correct answer is c) BIOS chip
The BIOS chip on the motherboard contains the Basic Input/ Output System (BIOS) firmware, which includes the CMOS (Complementary Metal-Oxide-Semiconductor) settings. These settings store configuration information for the computer's hardware and system parameters.

149. The correct answer is c) Northbridge and Southbridge
The chipset on a motherboard consists of two main components: the Northbridge and the Southbridge. The Northbridge handles the communication between the CPU, RAM, and high-speed peripherals, while the

Southbridge manages lower-speed peripherals and interfaces like USB and SATA.

150. The correct answer is b)
Increasing the clock speed of the CPU
Overclocking is the process of increasing the clock speed of a computer component, typically the CPU, to achieve higher performance. It involves running the component at a higher frequency than its default or rated speed, but it may require additional cooling and can potentially void warranties.

151. The correct answer is c)
Operating system
System software includes operating systems that manage computer hardware and provide common services for other software applications.

152. The correct answer is b)
Manage hardware resources
The primary purpose of an operating system is to manage hardware resources, such as memory, CPU, and storage, and provide an interface for users to interact with the computer system.

153. The correct answer is b)
Application software
Application software refers to software programs that allow users to perform specific tasks or applications, such as word

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

processing, spreadsheet, or graphics editing.

154. The correct answer is c) Web browser

Application software includes programs like web browsers, which allow users to access and browse websites on the internet.

155. The correct answer is b) Java

Java is a widely used programming language for developing web applications, along with other languages like JavaScript, HTML, and CSS.

156. The correct answer is c) Office suite

Office suites, such as Microsoft Office or Google Workspace, provide applications like word processors, spreadsheets, and presentation software for creating and editing documents.

157. The correct answer is b) Antivirus software

Antivirus software is designed to detect and protect against malicious software, such as viruses, malware, and other security threats.

158. The correct answer is b)

Database management system

Database management systems (DBMS) are software applications used to manage and organize databases, allowing users to store,

retrieve, and manipulate data efficiently.

159. The correct answer is c) Web browser

Web browsers, like Chrome, Firefox, or Safari, enable users to browse and access websites on the internet.

160. The correct answer is b) Utility software

Utility software includes programs that help optimize and improve the performance of a computer system, such as disk clean-up utilities, antivirus programs, and system optimization tools.

161. The correct answer is c) Semiconductor memory

The primary memory used in modern computers is semiconductor memory, specifically Random Access Memory (RAM). It provides fast access to data and instructions for the CPU.

162. The correct answer is d)

Accessing any storage location directly for both read and write operations

"Random access" in the context of memory means that any storage location can be accessed directly for both reading and writing operations. It allows for quick retrieval and modification of data.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

163. The correct answer is c)

Semiconductor memory
Semiconductor memory, such as RAM, is faster, cheaper, and provides more storage space in a smaller physical area compared to other types of memory like magnetic or optical memory.

164. The correct answer is a)
Volatility

The drawback of semiconductor memory is its volatility. It loses its contents when the power is switched off. This is in contrast to non-volatile memory like ROM, which retains its contents even without power.

165. The correct answer is c) RAM
(Random Access Memory)

RAM holds data and instructions that are waiting to be processed by the processor. It provides temporary storage for active programs and data during computer operation.

166. a) Dynamic RAM (DRAM) and Static RAM (SRAM)

The two types of RAM used in computer systems are Dynamic RAM (DRAM) and Static RAM (SRAM). They differ in their internal circuitry and performance characteristics.

167. a) Dynamic RAM (DRAM)

Dynamic RAM (DRAM) requires refreshing circuits to retain its

content. The refresh circuits recharge the capacitors in DRAM cells to prevent data loss.

168. The correct answer is b) Using capacitors

Dynamic RAM (DRAM) stores data using capacitors. The presence or absence of an electrical charge in the capacitor represents the logical values 1 and 0, respectively.

169. The correct answer is d) SRAM
(Static RAM)

Static RAM (SRAM) is typically used as processor caches and I/O buffers. It provides faster access times than dynamic RAM (DRAM) but is more expensive and consumes more power.

170. The correct answer is c) DDR RAM (Double Data Rate RAM)
DDR RAM (Double Data Rate RAM) gives faster performance by transmitting data on both the rising and falling edges of each clock pulse. This allows for higher data transfer rates.

171. The correct answer is b) Act as a data storage buffer between the processor and the visual display unit
Video RAM (VRAM) acts as a data storage buffer between the processor and the visual display unit. It stores image data required for the visual display on the monitor.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

172. The correct answer is d)

Rambus Corporation

RDRAM (Rambus Dynamic RAM)

was developed by Rambus Corporation. It is a proprietary technology and was used in high-end computers and video interface cards.

173. The correct answer is b)

RDRAM (Rambus Dynamic RAM)

RDRAM is considered the most expensive type of RAM. It offers high performance and fast data transfer rates, making it suitable for demanding applications.

174. The correct answer is b)

RDRAM (Rambus Dynamic RAM)

RDRAM is preferred for high-performance personal computers due to its fast computation speed and data transfer capabilities.

175. The correct answer is b) Dual Data Rate

DDR stands for Dual Data Rate. DDR RAM transmits data on both the rising and falling edges of each clock pulse, effectively doubling the data transfer rate compared to SDRAM.

176. The correct answer is a) Store image data for the visual display monitor

The purpose of VRAM (Video RAM) is to store image data required for the visual display on the monitor. It

acts as a buffer between the processor and the display unit.

177. The correct answer is c)

Semiconductor memory

Both dynamic RAM (DRAM) and static RAM (SRAM) are types of semiconductor memory, which means they are volatile in nature and lose their contents when power is switched off.

178. The correct answer is d) ROM (Read-Only Memory)

ROM (Read-Only Memory) is a type of non-volatile memory that retains its contents even when the power is switched off. It holds permanent instructions and data that cannot be modified.

179. The correct answer is a) Store frequently accessed data for faster retrieval

The cache memory in a computer system is used to store frequently accessed data for faster retrieval. It acts as a temporary storage closer to the CPU, reducing access latency.

180. The correct answer is c)

Connect all hardware components

The function of the motherboard in a computer system is to connect all hardware components together. It provides physical connections and pathways for data transfer between components.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

Certainly! Here are the explanations for the additional multiple-choice questions:

181. The correct answer is a) RAM
RAM (Random Access Memory) is a type of primary memory used for temporary storage, not a secondary storage device.

182. The correct answer is b) To store data permanently
Secondary storage devices are used to store data permanently, even when the power is turned off. They provide long-term storage for files, programs, and other data.

183. The correct answer is a) Hard disk
Hard disks are known for their faster performance and larger storage capacity compared to other secondary storage devices.

184. The correct answer is a) Slower performance
Floppy disks have slower performance compared to hard disks in terms of data transfer rates and access time.

185. The correct answer is a)
Compact Disk-Read Only Memory
CD-ROM stands for Compact Disk-Read Only Memory, indicating that the information stored on a CD is read-only and cannot be modified.

186. The correct answer is b) Motor
The motor in a floppy disk drive is responsible for rotating the floppy disk media.

187. The correct answer is d) Tracks
The tracks on a hard disk are concentric circles on the platter's surface where data is stored.

188. The correct answer is c)
Gigabytes (GB)
The storage capacity of a hard disk is commonly measured in gigabytes representing billions of bytes.

189. The correct answer is a) Read-only memory
A CD-ROM is a type of read-only memory, meaning the information stored on it cannot be modified.

190. The correct answer is a) Hard disk
Hard disks provide higher data transfer rates compared to other secondary storage devices like floppy disks, tape drives, or CD drives.

191. The correct answer is a) Platter surfaces
The read/write heads of a hard disk move radially across the surfaces of the platters to read or write data.

192. The correct answer is c) To position the read/write heads

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

The metal arms in a hard disk drive are responsible for positioning the read/write heads over the platter surfaces to access data.

193. The correct answer is b) Floppy disk

Floppy disks are removable secondary storage media, allowing them to be easily inserted and removed from disk drives.

194. The correct answer is d) Tape drive

Tape drives are commonly used for backup and archival purposes due to their large storage capacity and durability.

195. The correct answer is a) Faster access time

Hard disks provide faster access time to retrieve data compared to other storage devices like floppy disks, tape drives, or CD drives.

196. The correct answer is d) Tape drive

Tape drives use magnetic tapes as the storage medium.

197. The correct answer is b) Arm

The arm in a floppy disk drive moves the read/write heads forward and backward to access different tracks on the floppy disk.

198. The correct answer is a) 1.44 MB

The commonly used floppy disk in personal computers has a storage capacity of 1.44 megabytes (MB).

199. The correct answer is a)

Electro-mechanical

Most drives used for secondary memory, such as hard disks, floppy disks, tape drives, and CD drives, are based on electro-mechanical technology.

200. The correct answer is a) Hard disk

Hard disks generally provide better reliability of operation compared to other secondary storage devices due to their sturdy construction and robust design.

201. The correct answer is a)

Compact Disc-Read Only Memory

CD-RW stands for Compact Disc-Re-Writable, not Compact Disc-Read Only Memory.

202. The correct answer is a) They can be erased and reused.

CD-RW discs can be erased and reused, unlike CD-R discs where data cannot be changed once burned.

203. The correct answer is b) By infrared heat

Microscopic pits are created on the surface of a CD using infrared heat during the writing process.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

204. The correct answer is c) Low-intensity laser beam

A low-intensity laser beam is used to read the bits on a CD-ROM.

205. The correct answer is d) The sensor receiving the reflection

The sensor receiving the reflection determines whether each bit on a CD is a 1 or a 0.

206. The correct answer is c) Music storage

CDs were initially popular storage media for music before being used for general computer storage.

207. The correct answer is c) CD-RW can't be changed once burned.

CD-RW discs can be changed and erased, while CD-R discs cannot be changed once burned.

208. The correct answer is b) Laser diode

Laser diodes are used in CD drives to write data onto a CD.

209. The correct answer is c) To code information in the form of ups and downs

Pits and dumps on a CD surface represent the coded information as ups and downs.

210. The correct answer is a) To determine whether a bit is a 1 or a 0

The sensor detects the reflection and determines whether each bit is a 1 or a 0.

211. The correct answer is b) CD-R drive

CD-R drives are commonly found in personal computers.

212. The correct answer is d) The data stored on the disc cannot be changed.

When a CD-R is "burned," the data stored on the disc becomes permanent and cannot be changed.

213. The correct answer is c) Laser diode

The laser diode in a CD drive enables the CD to store and play music.

214. The correct answer is a) The presence of pits and dumps

The presence of pits and dumps on the CD surface allows the CD-ROM drive to read the information.

215. The correct answer is b) To create CDs that cannot be changed

The primary purpose of a CD-Recordable (CD-R) drive is to create CDs that cannot be changed once burned.

216. The correct answer is b) By heating the disc to different temperatures

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

Data is written on a CD-RW disc by heating the disc to different temperatures, which changes the reflective state.

217. The correct answer is b)

Amorphous state

The amorphous state of a CD surface reflects laser beam weakly, indicating the presence of pits.

218. The correct answer is b) Laser diode.

The laser diode in a CD drive reads the bits on a CD by detecting the reflection.

219. The correct answer is d) Ability to change between amorphous and crystalline states

The ability of CD-RW discs to change between amorphous and crystalline states allows them to be erased and reused.

220. The correct answer is c)

Heating to a high temperature

Heating a CD-RW disc to a high temperature causes it to become reflective.

221. The correct answer is b)

Operating system - The operating system acts as the manager of system resources and allocates them to specific programs as needed.

222. The correct answer is a) To

provide an interface between the

user and the hardware - The

primary function of an operating system is to provide a user-friendly interface that isolates the user from the hardware details.

223. The correct answer is a)

Process management - The

operating system manages the execution of programs as processes, deciding which process gets to run, for how long, and at what priority.

224. The correct answer is d)

Program execution - The process abstraction implemented by the operating system is responsible for managing the execution of programs.

225. The correct answer is c)

Keeping track of memory usage -

Memory management in an operating system involves organizing and addressing memory, allocating and freeing up memory, and maximizing its useful amount.

226. The correct answer is c)

Controlling and scheduling I/O

operations - Device management in an operating system involves allocating devices to processes and controlling access to input/output devices.

227. The correct answer is c) File

management - The operating system keeps track of every file in

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

the system, organizes them hierarchically into directories, and performs operations such as creating, deleting, modifying, and protecting files.

228. The correct answer is d) To perform operations on files - The file system in an operating system allows users and programs to perform various operations on files, such as creating, deleting, modifying, and opening files.

229. The correct answer is a) Interacting with the hardware directly - The kernel is the part of the operating system that interacts directly with the hardware, managing hardware resources and providing essential functions.

230. The correct answer is b) Initialization functions - When a computer boots up, it goes through initialization functions such as checking memory and then loads the kernel and transfers control to it.

231. The correct answer is c) Allows users to interact with the system - The user interface of an operating system provides users with a means to interact with and control the system.

232. The correct answer is b) Command-line interface - MS-DOS

and early versions of UNIX accepted only typed-in text commands as the user interface.

233. The correct answer is c) Mac and MS Windows - Mac and MS Windows are examples of operating systems that provide users with a graphical user interface.

234. The correct answer is b) Primary storage - The kernel, being intensively used, remains in primary storage (RAM) while other parts of the operating system may be transferred between primary and secondary storage.

235. The correct answer is d) Resource management - An operating system must provide facilities for controlling access to programs, processes, memory segments, and other system resources.

236. The correct answer is b) Kernel - The kernel component of an operating system interacts directly with the hardware, managing its operations.

237. The correct answer is c) Manage system resources - The primary purpose of an operating system is to manage system resources efficiently, including CPU, memory, and I/O devices.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

238. The correct answer is c) File management - File management involves organizing files hierarchically into directories and performing various operations on files.

239. The correct answer is d) All of the above - The operating system allocates memory, CPU time, and input/output devices to processes.

240. The correct answer is b) Secondary storage - While the kernel remains in primary storage (RAM), other parts of the operating system may be transferred between primary and secondary storage as required.

241. The correct answer is a) Process management - Process management involves managing the execution of multiple programs concurrently, including process scheduling and resource allocation.

242. The correct answer is c) To allocate system resources efficiently - Resource management in an operating system involves allocating system resources in an efficient and optimized manner.

243. The correct answer is a) Creating, deleting, and modifying files - The file system allows users and programs to perform operations on files, including

creating, deleting, and modifying files.

244. The correct answer is a) Scheduler - The scheduler component of the operating system manages the execution of programs and allocates CPU time to processes.

245. The correct answer is b) Icons, menus, and mouse movements - Modern operating systems provide users with graphical user interfaces that allow interactions through icons, menus, and mouse movements.

246. The correct answer is d) Device management - Device management involves controlling and scheduling accesses to input/output devices among processes.

247. The correct answer is d) Random access memory (RAM) - The kernel, being intensively used, typically remains in primary storage (RAM).

248. The correct answer is b) Memory management - Memory management involves allocating memory to processes, organizing memory usage, and handling memory requests and deallocations.

249. The correct answer is b) To manage system resources - The

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

main purpose of the kernel is to manage system resources, interact with hardware, and provide essential functions.

250. The correct answer is c) MS Windows and Linux - Examples of operating systems with different user interfaces and ways of interaction include MS Windows and Linux.

251. The correct answer is option a) ROM.

The operating system in such devices is typically stored in ROM (Read-Only Memory) because it provides immediate control of the processor when the device is turned on.

252. The correct answer is option a) Kernel.

The kernel, which is the core part of the operating system, is loaded into RAM at start-up and remains in memory for efficient access.

253. The correct answer is option a) Hard disk. In a personal computer, the operating system is typically stored on the hard disk due to its large size.

254. The correct answer is option d) Booting.

The general term for this process is booting. It involves various steps such as Power On Self Test (POST),

loading the boot loader, and transferring control to the operating system.

255. The correct answer is option b) To initialize the system components. The Power On Self Test (POST) is performed by the BIOS (Basic Input Output System) to check the functionality of system devices and ensure they are connected and working correctly.

256. The correct answer is option a) CMOS memory chip.

The system configuration data obtained from POST is compared with the system information stored on the CMOS (Complementary Metal-Oxide Semiconductor) memory chip located on the motherboard.

257. The correct answer is option b) 512 bytes. The Master Boot Record (MBR) is a block of data that is 512 bytes in size. It contains the bootstrap loader and other essential instructions for the boot process.

258. The correct answer is option a) ROM circuitry.

The ROM circuitry, which receives power when the computer is turned on, initiates the boot process.

259. The correct answer is option d) CMOS. The CMOS (Complementary Metal-Oxide Semiconductor)

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

memory chip stores the system information and is updated when new components are added to the system.

260. The correct answer is option c) Initiates the loading of the operating system. The boot loader program, located in the Master Boot Record (MBR), initiates the loading of the operating system. It transfers control to the operating system, allowing it to complete the boot process.

261. The correct answer is b) Fetch, decode, execute, store

The CPU carries out the instruction cycle, which consists of fetching the instruction from memory, decoding the instruction to determine the actions needed for execution, executing the instruction, and storing the result.

262. The correct answer is a) Program Counter (PC)

The Program Counter (PC) register keeps track of the memory address of the next instruction to be fetched and executed.

263. The correct answer is c) The instruction is loaded into the Instruction Register (IR)

During the fetch step, the instruction is fetched from main memory and loaded into the

Instruction Register (IR) for further processing.

264. The correct answer is a) Program Counter (PC)

After the instruction is fetched, the Program Counter (PC) is incremented to point to the memory address of the next instruction in the program.

265. The correct answer is a) The actions needed for execution

The decoding of the instruction determines the specific actions or operations that need to be performed in order to execute the instruction.

266. The correct answer is d) From a register or RAM through an address register

The data needed for instruction processing are fetched from either a register or RAM (main memory) using an address register to specify the memory location.

267. The correct answer is d) A register or a memory location

The result of the instruction is stored in either a register within the CPU or a specific memory location in RAM.

268. The correct answer is c) Incrementing the Program Counter (PC)

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

After executing the current instruction, the Program Counter (PC) is incremented to point to the memory address of the next instruction, triggering the continuation of the instruction cycle.

269. The correct answer is d) When the last instruction is fetched and executed successfully

The instruction cycle continues until the last instruction in the program is fetched, executed successfully, and there are no more instructions remaining.

270. The correct answer is c) Four steps

The instruction cycle consists of four steps: fetch, decode, execute, and store. These steps are repeated for each machine language instruction in the program.

- c) Speaker
- d) Keyboard

43. The process of temporarily storing data that is being transferred between two devices is called:

- a) Input
- b) Output
- c) Buffering
- d) Storing

44. Which type of computer memory is read-only and cannot be modified or erased by normal computer operations?

- a) RAM
- b) Cache Memory
- c) ROM

d) Virtual Memory

45. Which of the following is responsible for managing and controlling the overall operation of a computer system?

- a) Operating System
- b) Application Software
- c) System Software
- d) Firmware

46. The process of converting information into a coded form to prevent unauthorized access is known as:

- a) Encryption
- b) Decoding
- c) Compression
- d) Decryption

47. Which component of a computer is responsible for providing power to the CPU and other internal components?

- a) Power Supply
- b) Motherboard
- c) CPU
- d) RAM

48. Which type of software allows users to create, edit, and manipulate documents, spreadsheets, and presentations?

- a) Operating System
- b) Application Software
- c) System Software
- d) Firmware

49. Which of the following is an example of a processing operation performed by a CPU?

- a) Saving a file
- b) Copying text from a document

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

- c) Sorting a list of names in alphabetical order
d) Displaying an image on a screen
50. The process of transferring data from a computer to an external network or the internet is called:
a) Uploading
b) Downloading
c) Sharing
d) Streaming
51. Which component of a computer is responsible for temporarily storing the results of calculations performed by the CPU?
a) GPU
b) RAM
c) Hard Drive
d) Power Supply
52. Which of the following is an example of an input device that captures images or documents?
a) Printer
b) Microphone
c) Webcam
d) Monitor
53. The process of converting data from analog to digital form is called:
a) Input
b) Output
c) Storage
d) Digitization
54. Which type of computer memory is used to store frequently accessed data that is closer to the CPU for faster retrieval?
a) RAM
b) Cache Memory
c) ROM
d) Virtual Memory
55. Which of the following is responsible for managing and controlling the allocation of system resources in a computer?
a) CPU
b) Motherboard
c) Operating System
d) Hard Drive
56. The process of decoding and interpreting data received from an external device is called:
a) Input
b) Output
c) Processing
d) Decryption
57. Which component of a computer is responsible for storing the instructions and data that are currently being executed by the CPU?
a) GPU
b) RAM
c) Power Supply
d) Motherboard
58. Which type of software provides a platform for running application programs and acts as an interface between the user and the computer hardware?
a) Operating System
b) Application Software
c) System Software
d) Firmware
59. Which of the following is an example of a control operation performed by a CPU?
a) Playing a video game
b) Running a virus scan

SUNRISE CLASSES

- c) Performing arithmetic calculations
d) Saving a file
60. The process of transferring data from an external device to a computer's memory for processing or storage is called:
a) Input
b) Output
c) Processing
d) Downloading
61. Which component of a computer is responsible for executing instructions stored in the computer's memory?
a) CPU
b) GPU
c) RAM
d) Hard Drive
62. Which of the following is an example of an output device that produces a printed copy of a document?
a) Printer
b) Scanner
c) Speaker
d) Keyboard
63. The process of storing data in multiple storage locations simultaneously for redundancy and data protection is known as:
a) Input
b) Output
c) Replication
d) Archiving
64. Which type of computer memory retains its data even when the power is turned off?
a) RAM
b) Cache Memory
c) ROM
d) Virtual Memory
65. Which of the following is responsible for managing and controlling the input and output devices of a computer?
a) CPU
b) Motherboard
c) Operating System
d) Hard Drive
66. The process of converting data from digital to analog form is called:
a) Input
b) Output
c) Storage
d) Analogization
67. Which component of a computer is responsible for storing permanent data and programs even when the power is turned off?
a) GPU
b) RAM
c) Power Supply
d) Hard Drive
68. Which type of software is designed to perform specific tasks such as editing images, designing graphics, or creating animations?
a) Operating System
b) Application Software
c) System Software
d) Firmware
69. Which of the following is an example of a processing operation performed by a CPU?
a) Printing a document
b) Scanning a barcode
c) Playing a music file
