- a) MP3
- b) WAV
- c) MIDI
- d) WMA

260. Which sound file format is known for its small file size and is commonly used for online streaming and podcasting?

- a) MP3
- b) WAV
- c) AAC
- d) AIFF

261. Which video file format is commonly used for streaming videos on the internet?

- a) MP4
- b) AVI
- c) MOV
- d) WMV

262. Which video file format is widely supported by Apple devices and iTunes?

- a) MP4
- b) AVI
- c) MKV
- d) FLV

263. Which video file format is known for its high-quality and lossless compression?

- a) MP4
- b) AVI
- c) MOV
- d) FLV

264. Which video file format is specifically designed for DVDs and supports menu navigation?

- a) MP4
- b) AVI
- c) MPEG-2
- d) WMV

265. Which video file format is commonly used for animated graphics and supports transparency?

- a) MP4
- b) AVI
- c) GIF
- d) WMV

266. Which video file format is known for its high-quality and is commonly used in professional video editing?

- a) MP4
- b) AVI
- c) ProRes
- d) FLV

267. Which video file format is optimized for web streaming and is commonly used by YouTube?

- a) MP4
- b) AVI
- c) WebM
- d) MOV

268. Which video file format is commonly used for 3D video content?

- a) MP4
- b) AVI

@ISS COACHING DELHI SUNRISE CLASSES

- c) MKV
- d) SBS

269. Which video file format is specifically designed for video playback on mobile devices?

- a) MP4
- b) AVI
- c) 3GP
- d) FLV

270. Which video file format is commonly used for Blu-ray discs and supports high-definition video?

- a) MP4
- b) AVI
- c) MPEG-4 AVC
- d) WMV

271. RISC stands for:

- a) Random Integrated System Chip
- b) Reduced Instruction Set Computer
- c) Realistic Instructional System Code
- d) Rapid Interconnected Software Compiler

272. CISC stands for:

- a) Complex Integrated System Chip
- b) Compact Instructional System Code
- c) Complex Instruction Set Computer
- d) Complete Interconnected Software Compiler

273. In RISC architecture, the emphasis is on:

- a) Complex instructions and addressing modes
- b) Minimizing the number of instructions
- c) High-level programming languages
- d) Parallel processing

274. In CISC architecture, the emphasis is on:

- a) Simple instructions and addressing modes
- b) Minimizing the number of instructions
- c) Low-level programming languages
- d) Serial processing

275. RISC processors typically have:

- a) Large instruction sets
- b) Variable-length instructions
- c) Complex instruction execution units
- d) Small and fixed instruction sets

276. CISC processors typically have:

- a) Small instruction sets
- b) Fixed-length instructions
- c) Simple instruction execution units
- d) Large and variable-length instruction sets

277. Which type of architecture favors pipelining and instruction-level parallelism?

- a) RISC
- b) CISC
- c) Both RISC and CISC
- d) Neither RISC nor CISC

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

278. RISC processors use a load/store architecture, which means:

- a) Data processing operations are performed directly on memory
- b) Data is loaded and stored only in registers
- c) The architecture does not support memory operations
- d) The architecture uses a cache memory for load/store operations

279. CISC processors often include:

- a) Simple and specialized instructions
- b) Only arithmetic and logical instructions
- c) Complex branching instructions
- d) Single-cycle execution units

280. Which type of architecture is generally more power-efficient?

- a) RISC
- b) CISC
- c) Both RISC and CISC
- d) Neither RISC nor CISC

281. Which of the following is a characteristic of RISC architecture?

- a) Large instruction set
- b) Variable-length instructions
- c) Complex instruction execution units
- d) Emphasis on optimizing for code size

282. Which type of architecture typically requires fewer transistors to implement?

- a) RISC
- b) CISC
- c) Both RISC and CISC require the same number of transistors
- d) Transistor count is not related to architecture type

283. Which of the following is an advantage of CISC architecture?

- a) Reduced instruction execution time
- b) Smaller program size
- c) Fewer clock cycles per instruction
- d) Greater hardware complexity

284. Which type of architecture is more commonly used in embedded systems and mobile devices?

- a) RISC
- b) CISC
- c) Both RISC and CISC are equally common
- d) Neither RISC nor CISC are used in embedded systems

285. In which type of architecture are instructions typically executed in a single clock cycle?

- a) RISC
- b) CISC
- c) Both RISC and CISC require multiple clock cycles per instruction
- d) Instruction execution time is not related to architecture type

286. Which of the following is a characteristic of CISC architecture?

- a) Simple instruction sets
- b) Fixed-length instructions

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

- c) Emphasis on optimizing for code size
- d) Support for complex addressing modes

- b) Increased complexity of instruction execution
- c) Larger program size
- d) Slower clock speeds compared to CISC processors

287. Which type of architecture is generally easier to program for?

- a) RISC
- b) CISC
- c) Both RISC and CISC have similar programming complexity
- d) Programming complexity is not related to architecture type

288. Which of the following is true about RISC processors?

- a) They typically have higher clock speeds than CISC processors
- b) They execute instructions using microcode
- c) They require more memory access than CISC processors
- d) They have a larger number of instructions than CISC processors

289. Which type of architecture is generally more suitable for applications that require high performance and efficiency?

- a) RISC
- b) CISC
- c) Both RISC and CISC are equally suitable
- d) Neither RISC nor CISC are suitable for high-performance applications

290. Which of the following is a disadvantage of RISC architecture?

- a) Limited instruction set flexibility

SUNRISE CLASSES

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

Explanation

1. The correct answer is c) Monitor. The monitor is an output device that displays visual information from the computer, rather than being an input device that provides input to the computer.

2. The correct answer is b) RAM (Random Access Memory). RAM is a type of computer memory that stores data and instructions temporarily while the computer is running. It allows for quick access to data that the CPU (Central Processing Unit) needs to perform tasks.

3. The correct answer is d) Encoding. Encoding refers to the process of converting data into a format that can be understood and processed by a computer. It involves converting information into binary code (0s and 1s) that the computer can interpret.

4. The correct answer is a) CPU (Central Processing Unit). The CPU is responsible for executing instructions and performing calculations in a computer. It is often referred to as the "brain" of the computer.

5. The correct answer is a) Operating System. The operating system is software that manages computer hardware and software

resources. It acts as an intermediary between the user and the computer hardware, allowing users to interact with the computer and run application software.

6. The correct answer is c) Hard Drive. A hard drive is an example of secondary storage in a computer. It provides long-term storage for data and programs even when the computer is powered off.

7. The correct answer is b) Motherboard. The motherboard is a main component of a computer that houses and connects all the other hardware components. It provides the necessary connections and pathways for data and power to flow between the different components.

8. The correct answer is c) ROM (Read-Only Memory). ROM is a type of computer memory that retains its data even when the power is turned off. It stores important instructions and data that are permanently written during manufacturing and cannot be modified.

9. The correct answer is b) Input. While the CPU performs arithmetic, logic, and control operations, input is not a basic operation performed by the CPU. Input refers to the

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

process of providing data or commands to the computer.

10. The correct answer is b) Output. Output refers to the process of displaying information or results to the user. It can be in the form of text, images, sounds, or any other type of information that the computer presents to the user.

11. The correct answer is b) RAM. RAM (Random Access Memory) is responsible for storing instructions and data that are currently being used by the CPU. It provides fast and temporary storage for the CPU to access data quickly.

12. The correct answer is c) Printer. A printer is an example of an output device for a computer. It produces a physical copy (printout) of text, images, or other information from the computer onto paper or other media.

13. The correct answer is d) Fetching. Fetching refers to the process of retrieving information from a storage device (such as a hard drive) and loading it into the computer's memory (such as RAM) so that it can be accessed and processed by the CPU.

14. The correct answer is b) Cache Memory. Cache memory is a small, high-speed memory that is located

close to the CPU. It stores frequently accessed data and instructions to speed up the CPU's access to them, but it has a limited storage capacity compared to RAM or a hard drive.

15. The correct answer is a) CPU. The CPU (Central Processing Unit) is responsible for interpreting and executing program instructions. It performs calculations, logical operations, and controls the flow of data between different parts of the computer.

16. The correct answer is c) Storage. Storage refers to the process of saving data or instructions to a storage device (such as a hard drive, solid-state drive, or flash drive) for future use. It allows for long-term retention of data even when the computer is powered off.

17. The correct answer is b) GPU (Graphics Processing Unit). The GPU is responsible for converting digital data into a format that can be displayed on a monitor. It specializes in rendering and displaying images, videos, and other graphics-intensive tasks.

18. The correct answer is b) Application Software. Application software allows users to perform specific tasks or applications on a computer. Examples include word

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

processing software, spreadsheet software, and graphic design software.

19. The correct answer is c) Calculating the square root of a number. Arithmetic operations involve mathematical calculations, such as addition, subtraction, multiplication, and division. Calculating the square root of a number is an example of an arithmetic operation performed by a CPU.

20. The correct answer is d) Saving. The process of permanently storing data and instructions on a storage device, such as a hard drive is referred to as saving. It ensures that the data remains accessible even after the computer is powered off or restarted.

21. The correct answer is a) CPU (Central Processing Unit). The CPU is responsible for performing logical operations, such as AND, OR, and NOT, as part of its overall processing capabilities.

22. The correct answer is a) RAM (Random Access Memory). RAM is an example of volatile memory in a computer. It is temporary storage that loses its data when the power is turned off or the computer is restarted.

23. The correct answer is d) Decoding. Decoding refers to the process of converting data from a format that is not easily understood by humans into a human-readable form. It involves interpreting and translating encoded data into a meaningful representation.

24. The correct answer is a) Operating System. The operating system is the type of software that manages and controls the computer hardware. It provides a user interface through which users interact with the computer and manages the execution of application software.

25. The correct answer is d) Hard Drive. The hard drive is responsible for storing the operating system, system files, and user files in a computer. It provides long-term storage and retains data even when the power is turned off.

26. The correct answer is b) Cache Memory. Cache memory is a type of computer memory that serves as a temporary storage area for data that is frequently accessed by the CPU. It is faster to access than RAM, but it has a smaller storage capacity.

27. The correct answer is c) Processing. Processing refers to the execution of a sequence of instructions by the computer's CPU.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

It involves carrying out calculations, performing logical operations, and manipulating data according to the instructions provided.

28. The correct answer is c) Power Supply. The power supply component of a computer is responsible for supplying power to all the other components. It converts the AC (alternating current) power from the electrical outlet into DC (direct current) power that is required by the computer.

29. The correct answer is c) ROM (Read-Only Memory). ROM is a type of computer memory that stores instructions and data that are permanently programmed into it during manufacturing. It retains its contents even when the power is turned off.

30. The correct answer is b) Output. Output refers to the process of transferring data from a computer to an external device, such as a printer or a USB drive. It involves sending information or results from the computer to an external medium or device.

31. The correct answer is a) CPU. The CPU is responsible for performing arithmetic operations, such as addition, subtraction, multiplication, and division. It

handles the mathematical calculations required by the computer.

32. The correct answer is c) Webcam. A webcam is an example of an input device for a computer. It captures video and sometimes audio input, allowing users to record videos, participate in video conferences, or take pictures.

33. The correct answer is d) Processing. Processing refers to the manipulation and transformation of data in a computer. The process of rearranging, sorting, or organizing data in a specific order is a processing operation.

34. The correct answer is d) Virtual Memory. Virtual memory is a technique used by the computer's operating system to extend the available memory beyond the physical RAM. It uses a portion of the computer's storage device, such as a hard drive, to temporarily store data that cannot fit in RAM.

35. The correct answer is b) Motherboard. The motherboard is responsible for coordinating the activities of all the other hardware components in a computer. It provides the necessary connections and pathways for data and power to flow between the components.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

36. The correct answer is a) Input. The process of copying data from an external device, such as a CD or a USB drive, to a computer's storage is considered an input operation. It involves transferring data from an external source into the computer.

37. The correct answer is b) GPU (Graphics Processing Unit). The GPU is responsible for generating visual output on a display device, such as a monitor or a screen. It specializes in rendering and displaying graphics, images, and videos.

38. The correct answer is b) Application Software. Application software is designed to perform specific tasks or applications on a computer. Examples include photo editing software, music players, and web browsers.

39. The correct answer is c) Performing a comparison between two values. Performing a comparison between two values is an example of a control operation performed by a CPU. It involves evaluating conditions and making decisions based on the comparison results.

40. The correct answer is d) Saving. The process of storing data or instructions on a storage device for long-term use is referred to as

saving. It ensures that the data remains accessible even after the computer is powered off or restarted.

41. The correct answer is c) Motherboard. The motherboard is responsible for controlling the flow of data between the CPU and other devices in a computer. It provides the necessary connections and pathways for data transfer.

42. The correct answer is c) Speaker. A speaker is an example of an output device that produces sound. It is used for audio playback, such as playing music or hearing system notifications.

43. The correct answer is c) Buffering. Buffering is the process of temporarily storing data that is being transferred between two devices. It helps to smooth out any differences in the data transfer rates and ensures a continuous flow of data.

44. The correct answer is c) ROM (Read-Only Memory). ROM is a type of computer memory that is read-only and cannot be modified or erased by normal computer operations. It contains firmware or permanent instructions and data.

45. The correct answer is a) Operating System. The operating system is responsible for managing

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

and controlling the overall operation of a computer system. It provides services and resources to other software and handles tasks such as memory management, file management, and device management.

46. The correct answer is a) Encryption. Encryption is the process of converting information into a coded form to prevent unauthorized access. It involves using an algorithm and a key to scramble the data, making it unreadable without the corresponding decryption process.

47. The correct answer is a) Power Supply. The power supply component of a computer is responsible for providing power to the CPU and other internal components. It converts the electrical power from an outlet into the appropriate voltage and current required by the components.

48. The correct answer is b) Application Software. Application software allows users to create, edit, and manipulate documents, spreadsheets, and presentations. Examples include word processors, spreadsheet programs, and presentation software.

49. The correct answer is c) Sorting a list of names in alphabetical order.

Sorting a list of names in alphabetical order is an example of a processing operation performed by a CPU. It involves comparing and rearranging the data based on specific criteria.

50. The correct answer is a) Uploading. The process of transferring data from a computer to an external network or the internet is called uploading. It involves sending data from a local system to a remote location.

51. The correct answer is b) RAM (Random Access Memory). RAM is responsible for temporarily storing the results of calculations performed by the CPU. It provides fast and temporary storage for data and instructions that are actively being used by the CPU.

52. The correct answer is c) Webcam. A webcam is an example of an input device that captures images or documents. It is used for video conferencing, taking pictures, or recording videos.

53. The correct answer is d) Digitization. The process of converting data from analog to digital form is called digitization. It involves representing analog signals or information in a digital format that can be processed by a computer.

SUNRISE CLASSES

54. The correct answer is b) Cache Memory. Cache memory is used to store frequently accessed data that is closer to the CPU for faster retrieval. It is a high-speed memory that acts as a buffer between the CPU and the slower main memory (RAM).

55. The correct answer is c) Operating System. The operating system is responsible for managing and controlling the allocation of system resources in a computer. It ensures that different processes and applications have access to the necessary resources, such as CPU time, memory, and input/output devices.

56. The correct answer is b) Output. The process of decoding and interpreting data received from an external device is considered an output operation. It involves transforming encoded data into a format that can be understood and utilized by the user or other software.

57. The correct answer is b) RAM (Random Access Memory). RAM is responsible for storing the instructions and data that are currently being executed by the CPU. It provides temporary storage for data and instructions while the computer is running.

58. The correct answer is a) Operating System. The operating system provides a platform for running application programs and acts as an interface between the user and the computer hardware. It manages system resources, provides file management, and enables communication between hardware and software components.

59. The correct answer is c) Performing arithmetic calculations. Performing arithmetic calculations is an example of a control operation performed by a CPU. The CPU executes arithmetic instructions, such as addition, subtraction, multiplication, and division, based on the program's logic.

60. The correct answer is a) Input. The process of transferring data from an external device to a computer's memory for processing or storage is called input. It involves receiving data into the computer system for further manipulation or analysis.

61. The correct answer is a) CPU (Central Processing Unit). The CPU is responsible for executing instructions stored in the computer's memory. It performs the arithmetic, logical, control, and input/output operations of the computer.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

62. The correct answer is a) Printer. A printer is an example of an output device that produces a printed copy of a document. It takes digital information from a computer and prints it on paper or other printable media.

63. The correct answer is c) Replication. Replication is the process of storing data in multiple storage locations simultaneously for redundancy and data protection. It ensures that multiple copies of data are available in case of hardware failures or data loss.

64. The correct answer is c) ROM (Read-Only Memory). ROM retains its data even when the power is turned off. It contains permanent instructions or firmware that are stored during manufacturing and cannot be modified or erased by normal computer operations.

65. The correct answer is c) Operating System. The operating system is responsible for managing and controlling the input and output devices of a computer. It provides the necessary drivers, protocols, and interfaces for the communication between the computer system and the peripherals.

66. The correct answer is b) Output. The process of converting data from digital to analog form is considered an output operation. It involves transforming digital signals or information into analog formats that can be perceived or used by analog devices or humans.

67. The correct answer is d) Hard Drive. The hard drive component of a computer is responsible for storing permanent data and programs even when the power is turned off. It provides long-term storage for files, applications, and the operating system.

68. The correct answer is b) Application Software. Application software is designed to perform specific tasks such as editing images, designing graphics, or creating animations. It serves the needs of end-users and provides functionality beyond the core operating system.

69. The correct answer is c) Playing a music file. Playing a music file is an example of a processing operation performed by a CPU. The CPU processes the audio data and sends it to the audio output device, such as speakers or headphones, for playback.

70. The correct answer is a) Uploading. The process of

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

transferring data from a computer to an external device or network location is called uploading. It involves sending data from a local system to a remote location for storage, sharing, or further processing.

71. The correct answer is a) CPU (Central Processing Unit). The CPU is responsible for managing and executing the instructions of a computer program. It performs arithmetic, logical, control, and input/output operations based on the instructions stored in the computer's memory.

72. The correct answer is c) Touchscreen. A touchscreen is an example of an input device that detects and records hand movements. It allows users to interact with a computer or device by touching the screen directly, which can be used for various input gestures and commands.

73. The correct answer is d) Compression. The process of compressing data to reduce its size for storage or transmission is known as compression. It involves using algorithms to remove redundant or unnecessary information from the data, resulting in a smaller file size.

74. The correct answer is b) Cache Memory. Cache memory acts as a bridge between the CPU and the

larger, slower main memory. It stores frequently accessed data and instructions to provide faster access for the CPU, reducing the need to fetch data from the slower main memory.

75. The correct answer is c) Operating System. The operating system is responsible for managing and coordinating the resources of a computer system. It controls memory allocation, processor scheduling, device management, and provides an interface for users to interact with the computer.

76. The correct answer is c) Decryption. The process of converting encoded or encrypted data back into its original form is called decryption. It involves using a key or algorithm to reverse the encryption process and make the data readable or usable again.

77. The correct answer is b) RAM (Random Access Memory). RAM is responsible for storing data and instructions that are frequently accessed by the CPU for quick retrieval. It provides fast and temporary storage for data and instructions while the computer is running.

78. The correct answer is c) System Software. System software provides tools and utilities for managing and maintaining computer hardware

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

and software. It includes operating systems, device drivers, utility programs, and other software that supports the operation of the computer system.

79. The correct answer is b) Running a virus scan. Running a virus scan is an example of a control operation performed by a CPU. The CPU executes the instructions of the antivirus software to scan and analyze files and processes for potential threats.

80. The correct answer is b) Output. The process of transferring data from an external device or network to a computer's memory for access or storage is called input. It involves receiving data into the computer system for further manipulation or analysis.

81. The correct answer is b) GPU (Graphics Processing Unit). The GPU is responsible for performing floating-point calculations and rendering graphics. It is specialized hardware designed to handle complex graphical computations, such as those required for gaming, 3D rendering, and video editing.

82. The correct answer is c) Monitor. A monitor is an example of an output device that displays text and images on a screen. It allows users to visually interact with the

computer system and view the output of applications and software.

83. The correct answer is c) Modulation. The process of converting digital signals into analog signals for transmission over analog communication channels is called modulation. It involves modifying the characteristics of the digital signal to fit the properties of the analog transmission medium.

84. The correct answer is c) ROM (Read-Only Memory). ROM is non-volatile and retains its data even when the power is turned off. It contains permanent instructions or firmware that are stored during manufacturing and cannot be modified or erased by normal computer operations.

85. The correct answer is c) Operating System. The operating system is responsible for managing and controlling the communication between the computer hardware and software. It provides the necessary drivers, protocols, and interfaces for the interaction between different components of the computer system.

86. The correct answer is a)

Encryption. The process of encoding data to prevent unauthorized access or viewing is

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

called encryption. It involves using algorithms and keys to convert plain text or data into an unreadable form, which can only be decrypted back into its original form with the appropriate key.

87. The correct answer is b) RAM (Random Access Memory). RAM is responsible for temporarily storing data that the CPU needs to access quickly. It provides fast and temporary storage for data and instructions while the computer is running.

88. The correct answer is b) Application Software. Application software allows users to perform specific tasks such as word processing, spreadsheet calculations, or graphic design. It includes programs and applications that serve the needs of end-users and provide functionality beyond the core operating system.

89. The correct answer is c) Playing a music file. Playing a music file is an example of a processing operation performed by a CPU. The CPU processes the audio data and sends it to the audio output device, such as speakers or headphones, for playback.

90. The correct answer is b) Downloading. The process of transferring data from a network or the internet to a computer for

storage or processing is called downloading. It involves retrieving data from a remote location and saving it locally on the computer's storage.

91. The correct answer is b) Hard Drive. The hard drive is responsible for storing and retrieving data in a non-volatile manner. It provides long-term storage for files, applications, and the operating system even when the power is turned off.

92. The correct answer is b) Scanner. A scanner is an example of an input device that converts handwritten or printed text into digital form. It uses optical sensors to capture the text or image and convert it into a digital format that can be stored or manipulated by the computer.

93. The correct answer is c) Networking. The process of transferring data from one computer to another over a network or the internet is known as networking. It involves establishing connections, transmitting data packets, and managing the communication between different devices on the network.

94. The correct answer is b) Cache Memory. Cache memory is used to store frequently used instructions

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

and data to improve processing speed. It provides faster access to data and instructions compared to the main memory (RAM), which helps reduce the time taken to fetch data from the slower main memory.

95. The correct answer is c) Operating System. The operating system is responsible for managing the file system and providing access to files and folders in a computer. It controls file organization, access permissions, and provides a user interface to navigate and interact with files.

96. The correct answer is a) Input. The process of converting analog signals into digital signals for processing and storage is called input. It involves sampling and quantizing the continuous analog signal to discrete digital values that can be processed by the computer.

97. The correct answer is c) Power Supply. The power supply component of a computer is responsible for controlling the flow of electricity to different parts of the computer. It converts the incoming AC power from the wall outlet to DC power that is suitable for the computer's components.

98. The correct answer is a) Operating System. The operating system allows users to perform

basic computer operations, such as managing files and running applications. It provides a user-friendly interface and manages the overall operation of the computer system.

99. The correct answer is b) Running a virus scan. Running a virus scan is an example of a control operation performed by a CPU. The CPU executes the instructions of the antivirus software to scan and analyze files and processes for potential threats.

100. The correct answer is c) Streaming. The process of transmitting audio or video content over the internet in real-time is called streaming. It involves continuously delivering data packets to the recipient while allowing the recipient to access and consume the content without having to download the entire file beforehand.

101. The correct answer is a) CPU (Central Processing Unit). The CPU is responsible for executing instructions in a specific order and controlling the overall operation of the computer. It fetches, decodes, and executes instructions, performs calculations, and manages the flow of data within the computer system.

102. The correct answer is a) Printer. A printer is an example of

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

an output device that prints high-quality images and text on paper. It receives digital data from the computer and transfers it onto paper or other print media.

103. The correct answer is c) Indexing. The process of organizing and arranging data in a structured manner for efficient storage and retrieval is known as indexing. It involves creating indexes or data structures that enable quick access to specific data based on certain criteria, such as keywords or values.

104. The correct answer is b) Cache Memory. Cache memory is used as a temporary storage area between the CPU and the main memory. It holds frequently accessed instructions and data to reduce the time taken to retrieve data from the slower main memory.

105. The correct answer is c) Operating System. The operating system is responsible for managing the user interface, multitasking, and resource allocation in a computer system. It provides a platform for running applications, manages hardware resources, and facilitates communication between different components.

106. The correct answer is b) Output. The process of converting digital signals back into analog

signals for output to analog devices is called output. It involves transforming digital data into a format that can be understood and used by analog devices, such as speakers or monitors.

107. The correct answer is d) Hard Drive. The hard drive is responsible for storing the operating system, programs, and data permanently. It provides long-term storage for files and data even when the power is turned off.

108. The correct answer is b) Application Software. Application software is designed to perform specific tasks, such as photo editing, video editing, or web development. It includes programs and applications that cater to the specific needs and requirements of users.

109. The correct answer is d) Adding two numbers. Adding two numbers is an example of an arithmetic operation performed by a CPU. The CPU performs various arithmetic and logical operations on data, including addition, subtraction, multiplication, and division.

110. The correct answer is a) Uploading. The process of transferring data from a computer to a remote server or storage location over a network is called

SUNRISE CLASSES

uploading. It involves sending data from a local device to a remote destination.

111. The correct answer is a) CPU. The CPU is responsible for performing logical and arithmetic operations. It carries out calculations, comparisons, and logical operations on data based on the instructions provided by the program.

112. The correct answer is c) Microphone. A microphone is an example of an input device that captures sound and converts it into digital form. It detects and converts sound waves into electrical signals that can be processed and stored by the computer.

113. The correct answer is c) Encryption. The process of converting text or data into a coded form to prevent unauthorized access is known as encryption. It involves using algorithms and keys to transform data into an encrypted form that can only be decrypted with the appropriate decryption key.

114. The correct answer is c) ROM (Read-Only Memory). ROM is read-only and contains firmware or permanent instructions. It stores essential instructions that are required to boot up the computer

and perform basic system operations.

115. The correct answer is c) Operating System. The operating system is responsible for managing the memory resources and allocating them to different processes. It controls the allocation and deallocation of memory space for programs and data.

116. The correct answer is c) Modulation. The process of converting digital signals into analog signals for output to analog devices is called modulation. It involves modifying certain characteristics of the digital signal to carry information that can be interpreted by analog devices.

117. The correct answer is c) Power Supply. The power supply component of a computer is responsible for distributing electrical power to all other components. It converts the AC (alternating current) power from an outlet into DC (direct current) power required by the computer.

118. The correct answer is c) System Software. System software provides tools and utilities to maintain and optimize the performance of a computer system. It includes operating systems, device drivers, and system utility software.

SUNRISE CLASSES

119. The correct answer is c) Editing a document. Editing a document is an example of an output operation performed by a computer. It involves modifying the content or formatting of a document and generating an updated version as the output.

120. The correct answer is b) Downloading. The process of transferring data from a remote server or storage location to a computer over a network is called downloading. It involves retrieving data from a remote location and saving it on a local device.

121. The correct answer is a) CPU. The CPU is responsible for fetching, decoding, and executing instructions. It is often referred to as the "brain" of the computer as it performs the core processing tasks.

122. The correct answer is c) Projector. A projector is an example of an output device that displays images and videos on a large screen or surface. It projects the visual output from a computer onto a larger display area.

123. The correct answer is c) Sorting. The process of organizing and arranging data in a specific order to facilitate efficient searching is known as sorting. It involves rearranging data elements based on

certain criteria, such as numerical or alphabetical order.

124. The correct answer is b) Cache Memory. Cache memory is used to temporarily store frequently accessed data for faster processing. It is a smaller and faster memory than the main memory (RAM) and helps reduce the time taken to retrieve data from the slower RAM.

125. The correct answer is c) Operating System. The operating system is responsible for managing and controlling the flow of data between the CPU and other devices. It facilitates data transfer and communication between hardware components and software applications.

126. The correct answer is a) Input. The process of converting analog signals into digital signals for processing and storage is called input. It involves transforming continuous analog data, such as sound or video, into discrete digital form that can be processed by the computer.

127. The correct answer is c) Power Supply. The power supply component of a computer provides electrical power to all other components. It regulates and distributes the required voltage and

current to ensure proper functioning of the computer system.

128. The correct answer is a) Operating System. The operating system provides a platform for running applications and managing computer resources. It controls the allocation of resources, manages memory, handles input and output operations, and provides an interface for user interaction.

129. The correct answer is d) Comparing two numbers. Comparing two numbers is an example of a logical operation performed by a computer. It involves evaluating the relationship between two values, such as checking if one number is greater than, equal to, or less than the other.

130. The correct answer is b) Downloading. The process of transferring data from a remote location to a computer for backup or storage purposes is called downloading. It involves retrieving data from a remote server or storage location and saving it on a local device.

131. The correct answer is d) Motherboard. The motherboard is responsible for controlling and coordinating the activities of all other hardware components in a computer system. It provides the

electrical connections and pathways for communication between the CPU, RAM, storage devices, and other peripherals.

132. The correct answer is c) Touchscreen. A touchscreen is an example of an input device that allows users to interact with the computer by directly touching the screen. It detects and responds to the user's touch, enabling input through gestures, taps, or handwriting recognition.

133. The correct answer is c) Formatting. The process of converting data into a format suitable for transmission over a network is known as formatting. It involves organizing and structuring the data in a standardized way, often using protocols and encoding methods, to ensure compatibility and efficient transmission.

134. The correct answer is b) Cache Memory. Cache memory is used to store frequently accessed instructions and data that are not currently in the main memory (RAM). It acts as a high-speed buffer between the CPU and the slower main memory, helping to reduce memory access time and improve overall system performance.

135. The correct answer is c) Operating System. The operating
