system is responsible for managing and coordinating input and output devices in a computer system. It provides the necessary drivers and software interfaces to enable communication between the devices and the rest of the system.

136. The correct answer is c) Modulation. The process of converting digital signals into analog signals for output to analog devices is called modulation. It involves modifying certain characteristics of the digital signal, such as amplitude, frequency, or phase, to encode information that can be interpreted by analog devices like speakers or displays.

137. The correct answer is b) RAM (Random Access Memory). RAM is responsible for temporarily storing instructions and data that the CPU needs to access quickly during normal operation. It provides fast and temporary storage for data that is actively being used by the CPU.

138. The correct answer is b) Application Software. Application software is designed to perform specific tasks or applications, such as word processing, spreadsheet calculations, or graphic design. It provides tools and features tailored to the specific needs of users in various domains.

139. The correct answer is d)

Sending a command to a peripheral device. Sending a command to a peripheral device is an example of a control operation performed by a computer. It involves issuing instructions or commands to peripheral devices, such as printers or scanners, to initiate specific actions or operations.

140. The correct answer is c)

Streaming. The process of transferring data from a remote server or storage location to a computer over a network in real-time is called streaming. It involves receiving and playing back data as it is being transferred, allowing for continuous and uninterrupted playback of audio or video content.

141. The correct answer is a) CPU (Central Processing Unit). The CPU is responsible for executing mathematical calculations and logical operations in a computer. It performs arithmetic operations, such as addition and multiplication, as well as logical operations, such as comparisons and decision-making.

142. The correct answer is a)

Printer. A printer is an example of an output device that prints text and images on paper using ink or toner. It receives digital data from the computer and transfers it onto paper or other print media.

SUNRISE CLASSES

143. The correct answer is c) Transformation. The process of transforming data into a different representation while preserving its meaning is known as transformation. It involves modifying or converting data from one format or structure to another, often to meet specific requirements or to enable compatibility between systems.

144. The correct answer is c) ROM (Read-Only Memory). ROM is non-volatile and retains its data even when the power is turned off. It stores firmware or permanent instructions that are essential for booting up the computer and initializing the hardware components.

145. The correct answer is c) Operating System. The operating system is responsible for managing and controlling the execution of software programs on a computer. It provides an environment for software applications to run, manages system resources, and handles tasks such as process scheduling, memory management, and input/output operations.

146. The correct answer is c) Analog-to-digital conversion. The process of converting analog signals into digital signals for processing and storage is called analog-to-

digital conversion. It involves measuring the analog signal at regular intervals and representing the sampled values as discrete digital values.

147. The correct answer is c) Power Supply. The power supply component of a computer is responsible for supplying power to the other components. It converts the AC (alternating current) power from an outlet into the DC (direct current) power required by the computer system.

148. The correct answer is b) Application Software. Application software provides a platform for creating, editing, and managing documents, spreadsheets, and presentations. Examples of application software include word processors, spreadsheet programs, and presentation software.

149. The correct answer is c) Sorting a list of names. Sorting a list of names is an example of a data manipulation operation performed by a computer. It involves arranging a list of names in a specific order, such as alphabetical or reverse alphabetical, based on certain criteria.

150. The correct answer is a) Uploading. The process of transferring data from a computer

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

to a remote location or storage medium for backup or long-term storage is called uploading. It involves sending data from a local device to a remote server or storage location for storage or sharing purposes.

151. The correct answer is c) RAM (Random Access Memory). RAM is responsible for storing frequently accessed data and instructions for faster processing. It provides a fast and temporary storage area for data that the CPU needs to access quickly during program execution.

152. The correct answer is c) Graphics tablet. A graphics tablet is an example of an input device that allows users to enter data by handwriting on a touch-sensitive surface. It is often used by artists and designers for digital drawing or handwriting input.

153. The correct answer is d) Aggregation. The process of combining multiple sets of data into a single unit for efficient storage and processing is known as aggregation. It involves merging or consolidating data from different sources or databases to create a unified and coherent dataset.

154. The correct answer is d) Virtual Memory. Virtual memory is used as an extension of the main memory (RAM) to provide additional storage

capacity. It allows the computer to use a portion of the hard disk as if it were additional RAM, enabling the system to handle larger programs or data sets than what can fit in physical memory.

155. The correct answer is c) Operating System. The operating system is responsible for managing the communication between the computer's hardware components and the software applications. It provides the necessary software interfaces and drivers to enable interaction and coordination between the hardware and software layers of the system.

156. The correct answer is b) Output. The process of converting digital signals into analog signals for output to analog devices, such as speakers or headphones, is called output. It involves converting the digital data into analog waveforms that can be interpreted by analog devices to produce sound or other forms of output.

157. The correct answer is d) Motherboard. The motherboard is responsible for storing the computer's BIOS (Basic Input/Output System) and other firmware. It typically contains a chip or EEPROM (Electrically Erasable Programmable Read-Only Memory) where the firmware is stored.

SUNRISE CLASSES

158. The correct answer is c) System Software. System software provides tools and utilities for managing and controlling computer hardware resources. It includes the operating system, device drivers, system utilities, and other software components that enable the proper functioning and management of the computer system.

159. The correct answer is c) Playing a music file. Playing a music file is an example of a data processing operation performed by a computer. The computer reads and interprets the data in the music file, processes it, and outputs the audio signal to the speakers or headphones for playback.

160. The correct answer is b) Downloading. The process of transferring data from a remote location or storage medium to a computer system is called downloading. It involves receiving data from a server or storage location and saving it onto the local computer or storage medium.

161. The correct answer is b) Power Supply. The power supply unit (PSU) is responsible for converting the AC power from the wall outlet into DC power that the motherboard and other components can use. It provides power to the CPU, GPU,

RAM, and other hardware components.

162. The correct answer is d) Northbridge. The Northbridge is a chip on the motherboard that handles the communication between the CPU, memory, and high-speed peripherals. It controls the flow of data between these components and ensures their proper coordination.

163. The correct answer is a) Northbridge. The Northbridge connects the CPU to the memory modules, as well as other components such as the graphics card. It facilitates high-speed communication between these components.

164. The correct answer is d) EEPROM

The EEPROM (Electrically Erasable Programmable Read-Only Memory) chip on the motherboard stores the system's BIOS, which contains firmware instructions for initializing the computer hardware during startup.

165. The correct answer is c) Cache memory. Cache memory is a small, high-speed memory located on the CPU or within the CPU chip. It stores frequently accessed data and instructions to provide fast access for the CPU, reducing the need to access slower main memory.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

166. The correct answer is a) SATA controller. The SATA (Serial ATA) controller on the motherboard connects the CPU to SATA devices such as hard drives and optical drives. It enables the transfer of data between the CPU and these storage devices.

167. The correct answer is a) Northbridge. The Northbridge is responsible for managing the communication between the CPU and the memory modules. It ensures that data is efficiently transferred between the CPU and RAM.

168. The correct answer is c) Audio codec. The audio codec on the motherboard is responsible for providing audio capabilities, including processing and outputting sound. It may also include features for capturing audio input. Video capabilities are typically provided by the graphics card.

169. The correct answer is a) PCI Express slot. The PCI Express slot is a type of expansion slot on the motherboard that allows for the installation of additional hardware devices, such as graphics cards, sound cards, and network cards.

170. The correct answer is a) CMOS

The CMOS (Complementary Metal-Oxide-Semiconductor) is a chip on the motherboard that stores configuration settings, such as the system's hardware settings and the system clock. It is powered by a small battery, typically a CMOS battery, to retain the settings even when the computer is turned off.

171. The correct answer is d) FSB (Front Side Bus).

The Front Side Bus (FSB) is a bus that connects the CPU to other components on the motherboard, such as memory, expansion slots, and the Northbridge. It facilitates communication and data transfer between the CPU and these components.

172. The correct answer is c) Southbridge

The Southbridge is responsible for providing interfaces for connecting peripheral devices to the motherboard, including USB ports. It manages the communication between the CPU and devices such as USB controllers, SATA controllers, and audio controllers.

173. The correct answer is c) EEPROM

The EEPROM (Electrically Erasable Programmable Read-Only Memory) chip on the motherboard stores the system's firmware, including the BIOS (Basic Input/Output System). The BIOS contains the instructions

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

necessary for the computer to boot up.

174. The correct answer is b)

Voltage Regulator Module (VRM)

The Voltage Regulator Module (VRM) on the motherboard regulates and supplies the required voltage to the CPU. It ensures stable and reliable power delivery to the processor.

175. The correct answer is c)

Northbridge

The Northbridge chip on the motherboard handles the communication between the CPU and high-speed peripherals, including the graphics card. It provides a high-speed connection for data transfer between the CPU and the graphics card.

176. The correct answer is a) CMOS

The CMOS (Complementary Metal-Oxide-Semiconductor) chip on the motherboard stores the computer's configuration data, such as hardware settings, system clock, and BIOS setup information. It is powered by a small battery to retain the data when the computer is turned off.

177. The correct answer is b)

Ethernet port

The Ethernet port on the motherboard provides the connection interface for networking devices, such as Ethernet cables or

network adapters. It enables the computer to connect to a local area network (LAN) or the internet.

178. The correct answer is a) The

audio codec on the motherboard is responsible for converting digital signals from the CPU into analog signals for audio output. It handles the processing and conversion of audio signals, allowing them to be sent to speakers or headphones for sound reproduction.

179. The correct answer is c) The

memory controller is responsible for managing the computer's memory, including controlling the flow of data to and from the RAM (Random Access Memory). It handles memory-related operations such as read, write, and refresh cycles.

180. The correct answer is d)

The CMOS battery is responsible for maintaining the computer's configuration data, such as hardware settings and system clock, even when the computer is turned off. It provides power to the CMOS chip, which stores this information.

181. The correct answer is c)

Ethernet is a widely used interconnection method for networking computers. It allows multiple units to communicate and share data over a local area network (LAN).

182. The correct answer is a) The

bus is a common interconnection

SUNRISE CLASSES ISS

SUNRISE CLASSES

SUNRISE CLASSES

method used to connect the processor and memory modules on a computer motherboard. It provides a pathway for data transfer between these units.

183. The correct answer is a) USB (Universal Serial Bus) is a commonly used interconnection method for connecting peripheral devices to a computer. It allows for the easy connection and communication between various devices.

184. The correct answer is a) A bridge is used to connect two or more networks together. It acts as an intermediary device that forwards data packets between different network segments.

185. The correct answer is a) HDMI (High-Definition Multimedia Interface) is commonly used to connect display devices, such as monitors and TVs, to a computer. It allows for the transmission of high-quality audio and video signals.

186. The correct answer is a) The primary function of the bus in a computer system is to connect the CPU and memory. It serves as a communication pathway for data transfer between the two crucial components.

187. The correct answer is b) The data bus is responsible for transferring data between the CPU and memory. It carries the actual

data being processed or stored by the computer.

188. The correct answer is c) address bus is used to carry memory addresses from the CPU to memory. It specifies the location in memory where data needs to be read from or written to.

189. The correct answer is c) The control bus is responsible for transmitting control signals and coordinating the activities of various components in a computer system. It carries signals for tasks such as read/write control, interrupt signals, and clock signals.

190. The correct answer is d) The expansion bus is used to connect peripheral devices, such as printers and keyboards, to a computer. It allows for the expansion of the computer's capabilities by adding additional devices or components.

191. The correct answer is a) CPU (Central Processing Unit)

The CPU is the central component of a computer that performs most of the processing inside the computer. It executes instructions and performs arithmetic, logical, control, and input/output operations.

192. The correct answer is d) Connect and communicate between components

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

The motherboard serves as a central hub that connects and facilitates communication between various components of a computer system, such as the CPU, RAM, storage devices, and input/output devices.

193. The correct answer is a) Hard Drive

The hard drive is a non-volatile storage device in a computer system. It is responsible for storing data, files, and program instructions even when the computer is powered off.

194. The correct answer is a) Monitor

The monitor is an output device that displays visual output from the computer. It presents images, text, and videos to the user, allowing them to interact with the computer visually.

195. The correct answer is d) Temporarily store data for quick access

RAM is a type of computer memory that provides fast and temporary storage for data and program instructions that are actively being used by the CPU. It allows quick access to data, facilitating efficient computing operations.

196. The correct answer is a) Power Supply

The power supply unit (PSU) is responsible for converting and regulating the electrical power from an external source to provide the necessary voltages and currents to other components of the computer system.

197. The correct answer is a) Speakers

Speakers are output devices that produce sound or audio output. They convert electrical signals into audible sound waves, allowing users to hear audio content from their computer.

198. The correct answer is d)

Render and display graphics
The GPU is a specialized processor responsible for rendering and displaying graphics on a computer system. It accelerates the rendering of images, videos, and 3D graphics, improving visual performance.

199. The correct answer is a) Hard Drive

The hard drive is a non-volatile storage device that allows data to be stored and retrieved even when the computer is powered off. It provides long-term storage capacity for files and programs.

200. The correct answer is answer:

c) Provide power to other components

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

The power supply unit (PSU) converts and supplies electrical power from an external source to the various components of a computer system, providing the necessary energy for their operation.

201. The correct answer is b) The main idea behind Reduced Instruction Set Architecture (RISC) is to make hardware simpler by using a few basic instructions. This simplification helps improve performance.

202. The correct answer is c) The main idea behind Complex Instruction Set Architecture (CISC) is to use a single instruction to perform all loading, evaluating, and storing operations making it more complex compared to RISC.

203. The correct answer is a) RISC tries to reduce the cycles per instruction at the cost of the number of instructions per program. This means that RISC architectures aim for faster instruction execution by keeping each instruction simple and executing it quickly.

204. The correct answer is b) CISC attempts to minimize the number of instructions per program but at the cost of an increase in the number of cycles per instruction. CISC

architectures aim to perform complex operations in a single instruction, even if it takes longer to execute.

205. The correct answer is c) The characteristic associated with RISC is that instructions take a single clock cycle to execute. RISC architectures focus on simplicity and efficiency by reducing the complexity of instructions.

206. The correct answer is d) The characteristic associated with CISC is that it has less number of general-purpose registers as operations get performed in memory itself. CISC architectures aim to handle complex instructions that operate directly on memory.

207. The correct answer is a) Reduced Instruction Set Architecture (RISC) allows the use of a pipeline. Pipelining allows for the concurrent execution of multiple instructions, leading to improved performance.

208. The correct answer is a) Reduced Instruction Set Architecture (RISC) requires fewer transistors due to less complex commands. The simplicity of RISC instructions allows for a more streamlined and efficient hardware design.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

209. The correct answer is a) In the given example of adding two 8-bit numbers, the approach that divides the operation into parts is Reduced Instruction Set Architecture (RISC). RISC breaks down the operation into separate instructions like load, operate, and store.

210. The correct answer is a) Reduced Instruction Set Architecture (RISC) requires more memory to store longer programs. RISC programs tend to be longer because they require separate instructions for each operation, which can increase the overall memory footprint.

1. c) Simpler instructions
2. c) Simpler instructions
3. c) Consume less power
4. d) Increased memory usage
5. d) Slower execution
6. c) Execute instructions more quickly
7. d) Lower power consumption
8. c) Design and manufacture
9. d) Long-standing usage
10. b) CISC processors

211. The correct answer is c) The advantage of RISC processors is that they have simpler instructions. This simplicity makes them easier to decode and execute quickly, resulting in faster processing times.

212. The correct answer is c) RISC processors execute instructions faster than CISC processors because

they have a simpler instruction set. The simplicity allows for quicker execution of instructions.

213. The correct answer is c) RISC processors are preferred for portable devices because they consume less power. The reduced power consumption of RISC processors makes them more suitable for battery-powered devices.

214. The correct answer is d) The disadvantage of RISC processors is that they require more instructions to perform complex tasks compared to CISC processors. This increased instruction count can make RISC programs longer.

215. The correct answer is d) Complex instructions in CISC processors result in slower execution. The complexity of CISC instructions requires more time to decode and execute, leading to slower overall performance.

216. The correct answer is c) CISC processors are more memory efficient because they can perform multiple operations within a single complex instruction. This reduces the number of instructions needed to accomplish a task, resulting in more memory-efficient code.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

217. The correct answer is d) An advantage of CISC processors is lower power consumption. While RISC processors consume less power, this option refers specifically to the lower power consumption of CISC processors compared to other alternatives.

218. The correct answer is c) The complexity of CISC processors makes them more difficult to design and manufacture. The intricate instruction sets of CISC architectures require more intricate hardware design, which can increase the complexity of the manufacturing process.

219. The correct answer is d) CISC processors have a larger user base and more available software because they have been in use for a longer time compared to RISC processors. The established usage of CISC processors has led to a broader user community and a wider range of available software.

220. The correct answer is b) Higher power consumption is a disadvantage associated with CISC processors. Due to the more complex instruction sets, CISC processors typically consume more power compared to RISC processors.

221. The correct answer is b) Execution of instructions

- The microprocessor's main function is to execute instructions, which involves processing data, performing calculations, and controlling the flow of information within a computer system.

222. The correct answer is a) CMOS (Complementary Metal-Oxide-Semiconductor)

- CMOS technology is widely used in constructing microprocessors due to its low power consumption, high integration density, and reliable performance.

223. The correct answer is c) The number of bits processed in a single instruction

- The word length of a microprocessor refers to the number of bits that can be processed in a single instruction. A larger word length typically indicates a higher processing power.

224. The correct answer is b) Clock speed

- The clock speed, measured in MHz or GHz, determines how fast a microprocessor can execute a single instruction. A higher clock speed generally results in faster processing.

225. The correct answer is a) RISC (Reduced Instruction Set Computer)

- RISC architecture employs a reduced set of simple and uniform

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

instructions that can be executed in a single clock cycle. This design simplifies the microprocessor and allows for faster execution of instructions.

226. The correct answer is b) CISC (Complex Instruction Set Computer)

- CISC architecture provides a wide range of instructions, often with varying sizes, allowing for more complex and specialized operations to be performed efficiently.

227. The correct answer is c) EPIC (Explicitly Parallel Instruction Computing)

- EPIC architecture combines the advantages of RISC and CISC architectures by implementing parallel processing of instructions and using a set of complex instructions that contain both basic instructions and information for executing parallel instructions.

228. The correct answer is a) RISC (Reduced Instruction Set Computer)

- RISC architecture is relatively simple to design and manufacture, making it cost-effective compared to more complex architectures like CISC.

229. The correct answer is b) CISC (Complex Instruction Set Computer)

- CISC architecture reduces the program size by providing complex instructions that perform multiple

operations, which can result in fewer memory cycles required for program execution and improved overall speed.

230. The correct answer is c) EPIC (Explicitly Parallel Instruction Computing)

- EPIC architecture is designed to execute instructions in parallel, allowing for concurrent processing of multiple instructions and increased computational efficiency.

231. The correct answer is a) Cat.mp3

- This example represents an audio file with the file extension ".mp3". The "Cat" filename suggests that it contains audio data related to cats.

232. The correct answer is c) Car.avi at 20.mB

- Among the given options, the audio file "Car.avi" has the largest file size of 20 MB (megabytes), indicating that it occupies more storage space compared to the other options.

233. The correct answer is b) .rar

- The file extension ".rar" represents a compressed archive file format and is not specifically associated with audio files. The other options (.mp3, .wav, and .mid) are valid audio file extensions.

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

234. The correct answer is a) WAV
- The WAV (Waveform Audio File Format) is an uncompressed audio file format known for its larger file size and high audio quality. It preserves the original audio data without compression.

235. The correct answer is b) mp3
- The MP3 (MPEG-1 Audio Layer III) audio file format is widely used and is close to CD quality while offering good compression, resulting in smaller file sizes compared to uncompressed formats like WAV.

236. The correct answer is c) OGG
- The OGG audio file format is a newer format that is open-source and free from patents. It is designed to offer good audio quality and efficient compression.

237. The correct answer is a) GIF
- While not specifically related to audio files, the GIF (Graphics Interchange Format) is commonly used for animations and supports multiple frames, making it suitable for animating a graphic image.

238. The correct answer is c) OGG
- The OGG audio format is supported by a limited number of web browsers, including Chrome 6+, Firefox 3.6+, and Opera 10+. Other options like WAV and MP3 have broader support.

239. The correct answer is b) WAV
- WAV (Waveform Audio File Format) is an uncompressed audio file format that retains all the original audio data, resulting in larger file sizes compared to compressed formats like OGG.

240. The correct answer is b) Copyright
- Copyright legislation grants authors exclusive rights to their creative works, including audio recordings and edited sequences. It protects their ability to earn income from their creations.

241. The correct answer is b) MP3 is a widely used audio file format known for its compression, allowing for smaller file sizes without significant loss in audio quality.

242. The correct answer is d) FLAC is a lossless audio file format that provides high-quality compression, preserving the original audio data without any loss of information.

243. The correct answer is d) AIFF (Audio Interchange File Format) is commonly used for CD audio tracks and is uncompressed, resulting in high-quality audio files.

244. The correct answer is d) AC3 (Audio Codec 3) is a multichannel audio file format commonly used

SUNRISE CLASSES

for DVDs and supports surround sound.

245. The correct answer is c) AAC (Advanced Audio Coding) is widely supported by Apple devices and iTunes, offering good sound quality at smaller file sizes compared to MP3.

246. The correct answer is a) WAV (Waveform Audio File Format) is a widely used audio file format in professional audio production and recording due to its uncompressed nature and high audio quality.

247. The correct answer is b) MP3 is known for its small file size and is commonly used for online streaming due to its ability to maintain reasonable audio quality while reducing file size.

248. The correct answer is d) OGG is an open-source alternative to MP3 that offers similar compression but with improved sound quality and is often used for streaming and internet distribution.

249. The correct answer is d) MIDI (Musical Instrument Digital Interface) is not an audio file format but rather a standard protocol for communicating musical information and is commonly used for storing and exchanging MIDI data.

250. The correct answer is d) OPUS is an audio file format optimized for internet telephony and voice recordings, providing low-latency

and high-quality compression for voice data.

251. The correct answer is b) WAV (Waveform Audio File Format) is commonly used for CD audio tracks due to its uncompressed nature and compatibility with most audio players.

252. The correct answer is c) FLAC (Free Lossless Audio Codec) is a sound file format known for its lossless compression, meaning it provides high-quality audio while reducing file size without losing any audio data.

253. The correct answer is a) MP3 (MPEG-1 Audio Layer III) is widely used for streaming and online distribution of music due to its efficient compression, which allows for smaller file sizes while maintaining acceptable audio quality.

254. The correct answer is c) VOC (Creative Voice) is a sound file format specifically designed for speech and low bit rate applications, often used for voice recordings and telecommunications.

255. The correct answer is c) M4A is a sound file format commonly used in Apple devices and iTunes, offering good audio quality and support for advanced audio features.

256. The correct answer is c) AC3 (Audio Codec 3) is a sound file format that supports multichannel audio and is commonly used for DVDs, providing surround sound capabilities.

257. The correct answer is c) OPUS is a sound file format optimized for internet telephony and voice recordings, offering low-latency and high-quality compression for voice data.

258. The correct answer is c) OGG is a sound file format widely supported by web browsers for audio playback, providing a balance between audio quality and file size.

259. The correct answer is c) MIDI (Musical Instrument Digital Interface) is not a sound file format but rather a standard protocol for communicating musical information. It is commonly used for MIDI files, which store instructions for synthesizers and musical instruments.

260. The correct answer is a) MP3 is known for its small file size and is commonly used for online streaming and podcasting, offering a good balance between audio quality and file size.

261. The correct answer is a) . MP4 (MPEG-4 Part 14) is commonly used for streaming videos on the internet

due to its efficient compression, good video quality, and broad compatibility.

262. The correct answer is a) . MP4 is widely supported by Apple devices and iTunes, making it a popular video file format for these platforms.

263. The correct answer is c) MOV (QuickTime File Format) is known for its high-quality and lossless compression, making it suitable for professional video editing and preserving video fidelity.

264. The correct answer is c) MPEG-2 is a video file format specifically designed for DVDs, allowing for menu navigation and supporting the DVD video standard.

265. The correct answer is c) GIF (Graphics Interchange Format) is commonly used for animated graphics and supports transparency, making it suitable for animations and simple video clips.

266. The correct answer is c) ProRes is a video file format known for its high-quality and is commonly used in professional video editing applications due to its ability to preserve video fidelity and support high bitrates.

267. The correct answer is c) WebM is an open and royalty-free video file format optimized for web

@ISS COACHING DELHI SUNRISE CLASSES

SUNRISE CLASSES

streaming, commonly used by platforms like YouTube for efficient video delivery.

268. The correct answer is c) MKV (Matroska Video) is a video file format that supports 3D video content and is commonly used for storing high-definition video files with multiple audio and subtitle tracks.

269. The correct answer is a) MP4 is specifically designed for video playback on mobile devices due to its efficient compression, good video quality, and compatibility with mobile platforms.

270. The correct answer is d) MPEG-4 AVC (Advanced Video Coding), commonly referred to as H.264, is commonly used for Blu-ray discs and supports high-definition video with efficient compression while maintaining good video quality.

271. The correct answer is b) RISC stands for Reduced Instruction Set Computer, emphasizing the use of a simplified and streamlined instruction set.

272. The correct answer is c) CISC stands for Complex Instruction Set Computer, emphasizing the inclusion of complex and specialized instructions.

273. The correct answer is b) In RISC architecture, the focus is on minimizing the number of

instructions to achieve high performance and efficiency.

274. The correct answer is a) In CISC architecture, the focus is on providing a wide range of instructions, including complex addressing modes and specialized instructions.

275. The correct answer is d) RISC processors typically have a small and fixed instruction set, which simplifies the processor design and improves execution efficiency.

276. The correct answer is d) CISC processors typically have a large and variable-length instruction set, offering a wide range of instructions and addressing modes.

277. The correct answer is a) RISC architecture is well-suited for pipelining and instruction-level parallelism, allowing multiple instructions to be executed simultaneously.

278. The correct answer is b) RISC processors use a load/store architecture, where data is loaded and stored only in registers, enhancing efficiency and reducing memory access.

279. The correct answer is a) CISC processors often include a variety of simple and specialized instructions, providing flexibility and convenience to programmers.

280. The correct answer is a) RISC architecture is generally more power-efficient due to its simplified

@ISS COACHING DELHI SUNRISE CLASSES

SERVICE, TRUST & RESULT

SUNRISE CLASSES

instruction set and streamlined execution.

281. The correct answer is b) RISC architecture often uses variable-length instructions to optimize code size and improve instruction fetch efficiency.

282. The correct answer is a) RISC architecture typically requires fewer transistors to implement, making it more efficient in terms of hardware resources.

283. The correct answer is d) CISC architecture offers greater hardware complexity with its extensive instruction set and addressing modes, allowing for more flexible programming.

284. The correct answer is a) RISC architecture is commonly used in embedded systems and mobile devices due to its simplicity, efficiency, and power-saving capabilities.

285. The correct answer is a) RISC processors are designed to execute instructions in a single clock cycle, contributing to their efficiency and high performance.

286. The correct answer is d) CISC architecture supports complex addressing modes, allowing for more flexible and powerful instruction execution.

287. The correct answer is a) RISC architecture is generally considered easier to program for due to its simplified instruction set and predictable execution behavior.

288. The correct answer is a) RISC processors often have higher clock speeds, enabling faster instruction execution compared to CISC processors.

289. The correct answer is a) RISC architecture is well-suited for applications that require high performance and efficiency, thanks to its streamlined instruction set and optimized execution.

290. The correct answer is a) One of the disadvantages of RISC architecture is its limited instruction set flexibility, which may require more instructions to perform certain complex tasks.

Computer Memory

1. Which unit of a computer system is responsible for executing instructions and performing calculations?
 - a) Central Processing Unit (CPU)
 - b) Random Access Memory (RAM)
 - c) Input/Output (I/O) Unit
 - d) Secondary Storage Unit
2. Which unit of a computer system is responsible for storing data and instructions that the CPU can access quickly?
 - a) Central Processing Unit (CPU)
 - b) Random Access Memory (RAM)
 - c) Control Unit
 - d) Arithmetic Logic Unit (ALU)
3. Which unit of a computer system is responsible for controlling and coordinating the activities of all other units?
 - a) Central Processing Unit (CPU)
 - b) Random Access Memory (RAM)
 - c) Control Unit
 - d) Arithmetic Logic Unit (ALU)
4. Which unit of a computer system is responsible for storing data and programs permanently?
 - a) Central Processing Unit (CPU)
 - b) Random Access Memory (RAM)
 - c) Secondary Storage Unit
 - d) Control Unit
5. Which unit of a computer system is responsible for converting data into a form suitable for processing by the computer?
 - a) Input/Output (I/O) Unit
 - b) Arithmetic Logic Unit (ALU)
 - c) Control Unit
 - d) Central Processing Unit (CPU)
6. Which unit of a computer system is responsible for receiving input from external devices and sending output to them?
 - a) Control Unit
 - b) Random Access Memory (RAM)
 - c) Input/Output (I/O) Unit
 - d) Secondary Storage Unit
7. Which unit of a computer system is responsible for performing logical and arithmetic operations?
 - a) Arithmetic Logic Unit (ALU)
 - b) Control Unit
 - c) Input/Output (I/O) Unit
 - d) Secondary Storage Unit
8. Which unit of a computer system is responsible for controlling the flow of data between the CPU, memory, and external devices?
 - a) Control Unit
 - b) Arithmetic Logic Unit (ALU)
 - c) Input/Output (I/O) Unit
 - d) Random Access Memory (RAM)
9. Which unit of a computer system is responsible for storing data and programs that are not currently being used by the CPU?
 - a) Control Unit

SUNRISE CLASSES

- b) Arithmetic Logic Unit (ALU)
c) Random Access Memory (RAM)
d) Input/Output (I/O) Unit
10. Which unit of a computer system is responsible for performing arithmetic and logical operations on data?
a) Control Unit
b) Random Access Memory (RAM)
c) Arithmetic Logic Unit (ALU)
d) Secondary Storage Unit
11. Which unit of a computer system is responsible for storing instructions and data that are permanently stored even when the computer is turned off?
a) Central Processing Unit (CPU)
b) Random Access Memory (RAM)
c) Secondary Storage Unit
d) Control Unit
12. Which unit of a computer system is responsible for managing the flow of data between the CPU, memory, and other devices?
a) Control Unit
b) Arithmetic Logic Unit (ALU)
c) Input/Output (I/O) Unit
d) Random Access Memory (RAM)
13. Which unit of a computer system is responsible for providing temporary storage for data and instructions that are actively being used by the CPU?
a) Central Processing Unit (CPU)
b) Random Access Memory (RAM)
c) Control Unit
d) Secondary Storage Unit
14. Which unit of a computer system is responsible for performing mathematical calculations and logical operations?
a) Control Unit
b) Random Access Memory (RAM)
c) Arithmetic Logic Unit (ALU)
d) Input/Output (I/O) Unit
15. Which unit of a computer system is responsible for receiving input from users and sending output to display devices?
a) Control Unit
b) Random Access Memory (RAM)
c) Input/Output (I/O) Unit
d) Secondary Storage Unit
16. Which unit of a computer system is responsible for controlling the overall operation of the computer, including managing resources and running applications?
a) Control Unit
b) Central Processing Unit (CPU)
c) Secondary Storage Unit
d) Operating System
17. Which unit of a computer system is responsible for storing large amounts of data and programs in a non-volatile manner?
a) Control Unit
b) Arithmetic Logic Unit (ALU)
c) Random Access Memory (RAM)
d) Secondary Storage Unit
18. Which unit of a computer system is responsible for performing logical operations and making decisions based on the instructions given to the computer?
a) Input/Output (I/O) Unit
b) Control Unit
c) Arithmetic Logic Unit (ALU)

SUNRISE CLASSES

- d) Random Access Memory (RAM)
19. Which unit of a computer system is responsible for managing the physical connections between the computer's components?
- Control Unit
 - Random Access Memory (RAM)
 - Input/Output (I/O) Unit
 - Motherboard
20. Which unit of a computer system is responsible for storing data and programs that are not currently being used by the CPU, but can be accessed when needed?
- Control Unit
 - Arithmetic Logic Unit (ALU)
 - Random Access Memory (RAM)
 - Secondary Storage Unit
21. Which unit of a computer system is responsible for executing and coordinating instructions for performing specific tasks?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Control Unit
 - Secondary Storage Unit
22. Which unit of a computer system is responsible for temporarily storing data and instructions that the CPU needs to access frequently?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Control Unit
 - Arithmetic Logic Unit (ALU)
23. Which unit of a computer system is responsible for managing and controlling the overall operation of the computer?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Control Unit
 - Operating System
24. Which unit of a computer system is responsible for providing long-term storage for data and programs even when the computer is turned off?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Secondary Storage Unit
 - Control Unit
25. Which unit of a computer system is responsible for converting digital signals into analog signals for output to external devices?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Control Unit
 - Digital-to-Analog Converter (DAC)
26. Which unit of a computer system is responsible for managing the input and output operations between the computer and external devices?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Control Unit
 - Input/Output (I/O) Controller
27. Which unit of a computer system is responsible for performing mathematical calculations and logical operations on data?
- Central Processing Unit (CPU)
 - Random Access Memory (RAM)
 - Control Unit
 - Arithmetic Logic Unit (ALU)
